MONTHLY REVIEW OF PORTFOLIO PERFORMANCE TO 30 April 2007

By T H Friedrich – Managing Director Retirement Fund Solutions Namibia (Pty) Ltd

The monthly review of portfolio performance, as set out in this issue, is now also available on our website at www.rfsol.com.na.

1. Investment Portfolios Performance (consult table below for full name of portfolio)

In April the average prudential balanced portfolio returned 3.68% (March 3.91%). Best and worst performance **for the month** was delivered by Allan Gray (4.65%) and Stanlib (2.08%), respectively. **For the 3 months** ended April 2007 (graph 9), best and worst performance was delivered by Allan Gray (11%) and NAM (6.9%), respectively, the average portfolio delivering 9.2% (March 8.4 %). **For the 12 months** ended April 2007 (graph 12), best performance was delivered by Allan Gray (36.3%) and worst performance again by Stanlib (23.4%), the average portfolio delivering 30.9% (March 28.4%). Graphs 10, 11, 13 and 14 reflect the performances for the year-to-date, 6 months, 3 years and 5 years to 30 April 2007, respectively.

Cumulative long term performance of prudential balanced portfolios is reflected in graphs 15 and 16. Take note that graph 15 has March 1998 as starting point while graph 16 reflects cumulative performance starting January 2003. Over the long-term Allan Gray is miles ahead while over the shorter term it is still ahead, but only by a very small margin. Graphs 17 and 18 present the performance of these portfolios vs CPI over rolling 3 year periods since September 2001.

Graphs 19 and 20 provide a more in depth look at the monthly performance of these portfolios over the past 12 months. Does your manager's performance make sense relative to the monthly returns of the main equity sectors in graphs 22 and 23 over the same period? Which sectors seem to impact on your manager's performance consistently? Is this consistent with its asset and sector allocation (refer to our Manager Review at 31 March 2007 on our website)?

2. Special Mandate Portfolio Performance

For the more cautious and conservative investor, consider the special mandate portfolios, whose rolling 6 month returns are reflected in graph 21, relative to the average prudential balanced portfolio. Track each one's performance against the average to get a feel for the behaviour of these portfolios in relation to the typical prudential balanced fund. Take note that these portfolios reflect in grey in the performance graphs. Benchmark investors should take note that as from July, the fund's default portfolio will comprise of Metropolitan Absolute Return and Prudential Inflation Plus funds in equal shares. This should reduce performance volatility and risk even further.

3. Asset Class Performance

Graphs 1 and 2 reflect the performance of the main asset classes for the 3 months and the 12 months ended April 2007. For the 3 months, Property UT* (15.9%) again outperformed all other asset classes, coming in second best over 12 months at 24.4%. The Allshare* index was the next best performing asset class over 3 months (11.7%) but far out performed all others over 12 months (36.7%). Worst performing asset classes over the past 3 months were Bonds* (4.4%) and lastly Cash* (2.1%). Over 12 months bonds and cash also produced the lowest return of 11% and 8.5%, respectively. For the purpose of doing more in depth analyses, graphs 24 and 25 reflect the performance build up of various indices from 1 January 2006 to date. Take note of the movement since the start of this year.

4. Investment Style and Market Capitalization

Graphs 3 and 4 show that 'Value'* and 'Growth'* companies performed quite similarly for the 3 months (11.8 % versus 11.7%) and the 12 months (36.2% versus 35.4%). Looking at market capitalization, 'large caps' (Top 40* 11%) significantly under performed 'Mid*' (15.1%) - and 'Small Caps*' (20%) over 3 months and over 12 months (35.5% vs 41.9% vs 51.4% respectively).
The following abbreviations are used in the graphs below (note that some abbreviations were truncated in the conversion process; rather focus on colours):

Benchmarks	
Namibian Cons Price Index	CPI Cum
JSE Allshare Index	JSE Cum
Average Portfolio (prudential, balanced)	Aver
Special Mandate Portfolios	
Sanlam Cash	BM Cash (no colour)
Investec High Income (IBA)	Inv High (no colour)
Metropolitan Absolute Return	Metr ARF (grey)
Prudential Inflation Plus	Pru Infl+ (grey)
Old Mutual Dynamic Floor	OM DF (grey)
Sanlam Inflation Plus	Sanl Infl+ (grey)
Market related portfolios	
Allan Gray Balanced	A Gr (blue)
Investec Managed	Invest (blue)

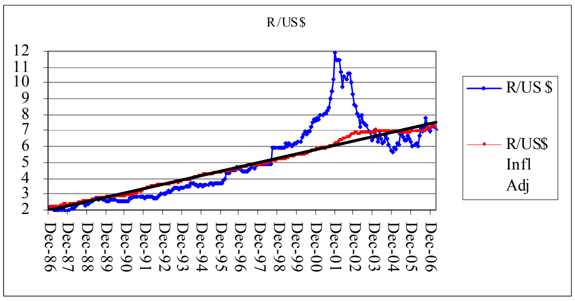
5. Preview for the next 6 months

A key factor for continued bullish sentiment towards local equities appears to be significant foreign interest and a steady built up of foreigners holdings in local equities over the past 5 years although more recently this interest appears to be receding somewhat. This could make the Rand./Namibia Dollar more volatile and more sensitive, although graph 26 indicates, that the Rand, adjusted for the differential in US and SA CPI, is currently fairly valued against the US$.

Graph 26

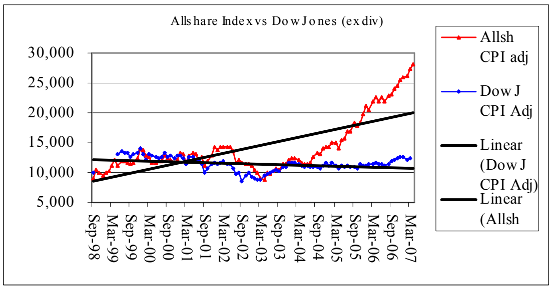


Despite high earnings over the past few years that are unlikely to be sustainable, the bull run of our local markets produced exceptional returns over the past 3 years and a historically high price: earnings ratio of currently around 17. Analysts make us believe though that another year of earnings, expected to be between 20% and 30% should reduce this ratio down to just over 12, very much in line with the MSCI emerging market index. Will the foreign interest persist and continue to underpin our local markets?

Over the first quarter of 2007 foreigners were net buyers of local equities to the tune of R/N$ 20.6 bn, but lower than the R/N$ 32.8 bn of the first quarter of 2006. This trend continued into April and May, net purchases to date amounting to R/N$34 bn compared to R/N$ 52 bn for the same period last year. Statistics indicate that global emerging market fund weightings in SA are currently around 8%, still slightly below a neutral weighting of 8.5%. Higher local real interest rates, the steady Rand/Namibia Dollar and strong commodity prices have probably made their contribution towards foreigners' positive sentiment. As the statistics for this year to date seem to indicate, the buying spree of foreigners is receding.

Graph 27 below gives an interesting view of the DOW Jones and the SA Allshare indices, both CPI adjusted since 1998 and does give one reason to be concerned about the current level of our local markets.

Graph 27



6. Conclusion

To allow local earnings to catch up with current price levels in order to produce a more internationally competitive price: earnings ratio of around 12, our local markets should take a breather for the next 12 months but still present potential for down rating. Under these circumstances hedging against possible political shocks or unexpected down rating we prefer a higher level of protection and thus high income yielding investments. The Rand/Namibia Dollar similarly faces more potentially bad than good news on various fronts and we would consequently also maximise our offshore exposure to diversify risk.
